

Lecture 6 Task — Build Your Own Portfolio Website

Markdown In, HTML Out · AI-Assisted Web Page

Objective

The purpose of this task is to practise the workflow you learned in the “**Markdown In, HTML Out**” crash course: write your idea as clean, structured **Markdown**, then ask an AI tool to turn it into a real **HTML** web page.

You will build a simple **one-page personal portfolio website** about yourself. The goal is not a perfect, professional site — it is to show that you can describe what you want in Markdown and get a working HTML page back, then improve it through a few prompt iterations.

Task — Create Your Portfolio Page Using AI

Using an AI tool, build a single-page portfolio website about yourself. You may use:

- ChatGPT
- Gemini / Google AI Studio
- Any other AI chat or coding tool

Follow the three steps below.

Step 1 — Write yourself in Markdown

Describe yourself using Markdown headings and bullets. Copy this starter and fill in your own details:

```
# [Your Name]

## About me
One or two friendly lines about you.

## Skills
- Skill one
- Skill two
- Skill three

## Projects
- Project name – what it does (add a link if you have one)

## Contact
- Email · WhatsApp · City
```

Step 2 — Ask the AI to build the page

Paste your Markdown into the AI tool, then ask:

PROMPT TO PASTE

“Turn this into a clean, mobile-friendly, one-page portfolio website in HTML. Use clear sections, a nice colour theme, and make it look professional. Give me a single HTML file.”

Step 3 — Grade and improve it

Open the page, see how it looks, then keep improving it:

PROMPT TO PASTE

“Grade this page out of 10 for design and readability, then improve it.”

Repeat until you are happy. Try changing the colours, adding a photo, or adding a new section.

Requirements

Your portfolio page must include:

- Your **name** as the main heading
- An **About me** section
- A **Skills** section
- At least **one project**
- A **Contact** section
- A design that **works on a phone** (mobile-friendly)
- A single, self-contained **HTML file**

Encouraged (for extra credit)

- Improve the page through **several prompt iterations**, not just one
- Add a photo, project images, or icons
- Add links (GitHub, LinkedIn, email)
- Add a colour theme, dark mode, or a small animation
- **Publish it online** (e.g. one-click publish or GitHub Pages) and include the live link

How to Submit

Submit your work as a **GitHub repository link**. Follow these steps:

1. Create a **new GitHub repository** (for example: my-portfolio).
2. Add your portfolio **HTML file** to the repository (name it `index.html`).
3. (Optional) Add a short `README.md` describing your project and the prompts you used.

4. Copy your repository link, e.g. `https://github.com/your-username/my-portfolio`
5. Submit the **repository link** on the Panaversity Dashboard / Portal.

If you published your page online, also include the **live link** (e.g. your GitHub Pages URL).

Deliverables

- Your portfolio **HTML file**, inside the repository
- The **GitHub repository link** (required)
- *(Optional)* A live published link
- *(Optional)* The prompts you used, written in the README

Evaluation Criteria

- Correct use of the **Markdown** → **HTML** workflow from class
- All required sections present (name, about, skills, projects, contact)
- Page is clean, readable, and mobile-friendly
- Effort and **prompt iterations / improvements**
- Creativity and personal touch
- Completeness of submission (working repo link)
- **Bonus:** a published live link
